

## FOCUS ON:

**Improving Network Performance, Service and Application delivery without spending budget unnecessarily.**

## Don't spend budget on IT and Network upgrades unless you really need to.

In these "challenging times", organisations need to question every penny spent, to ensure that any expenditure brings tangible financial and business benefits.

This is no more true than within the IT and Network arena.

With manufacturers, and vendors promoting new technologies, upgrades to hardware and applications, the average organisation can easily be encouraged to spend precious budget on IT "improvements".

But, without a real understanding of how your LAN and WAN environments are really performing, and the metrics to prove it, you could be wasting money on unnecessary upgrades.

Our low cost independent IT Health Check and, expert analysis will identify areas that can be improved without the need for any capital expenditure.

### A few tips:

- Identify all unused ports on devices such as switches within your infrastructure, thus bringing them back into use and negating the need to purchase unnecessary hardware:  
***NO NEED TO BUY MORE SWITCHES.***
- Identify unnecessary traffic and Protocols. Ensuring a reduction in wasted bandwidth use, and improving the Network performance and service delivery to users:  
***NO NEED TO UPGRADE LINKS, SWITCHES OR ROUTERS.***

- Identify "legacy" configurations and settings on Routers, Switches and Servers etc.. that are compromising the best performance of the network and service delivery:  
***IMPROVE NETWORK PERFORMANCE AND SERVICE DELIVERY AT NO CAPITAL COST!***

- Identify and analyse "Bottlenecks" and high usage areas, that may be resolved by, simply rebalancing switch or router traffic distribution, there by making better use of available, unused band width:  
***NO NEED TO UPGRADE LAN AND WAN LINKS.***

These and other Management and Control measures will result in improved performance and service delivery at a fraction of the cost of system and infrastructure upgrades.

## STOP!

**Think twice before you use a vendor, manufacturer, or other organisation "With an axe to grind" to do this analysis.**

Ensure that you either use your own personnel and analysis tools to gather the metrics, and produce an unbiased report, or, use an organisation that can demonstrate its capabilities and total independence.

Without the guarantee that the report and its recommendations have come from a source that has no interest in increasing its revenue by advising spending budget, rather than time on implementing the corrective actions, you may not be basing your decisions on indisputably unbiased "Facts".

Our low cost **Totally Independent IT Health Check** and, **expert analysis** will identify areas that can be improved without the need for any capital expenditure.

The service will look in depth at the overall health of your IT and Data network/s and address in detail the following:

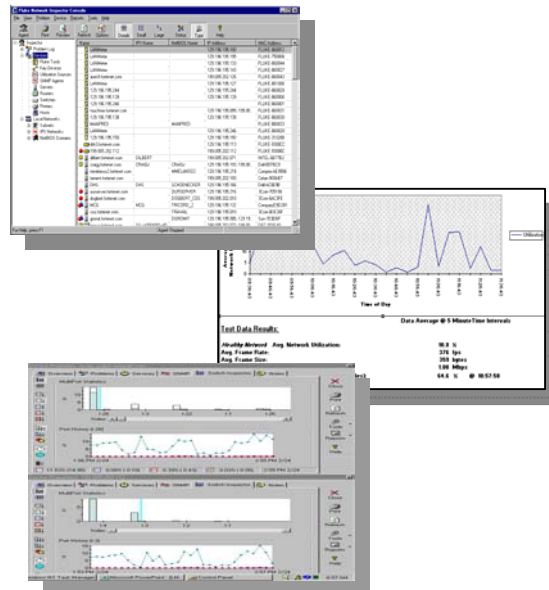

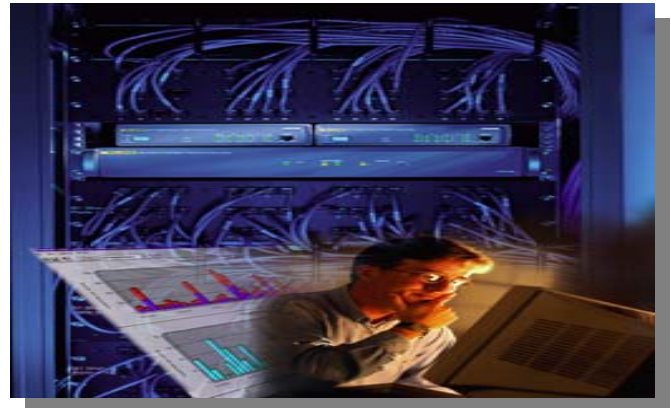

- Cable Infrastructure.
- Traffic and Error Profile.
- Addressing Structure for TCP / IP, Netbios, Novell etc.
- Top Senders, Receivers and Broadcasters.
- Protocol Mix.
- Conversation profiles
- The Performance of Switches and Routing Devices.
- Full Network Inventory IP, IPX, NetBIOS etc...
- Configuration issues
- Bottlenecks
- Plus, customer defined areas of concern

Results will be summarised in a full report with graphical representations of each area of performance that will highlight any issues of concern. In conjunction with these we will outline any recommended solutions to problems and precisely outline changes that will improve the performance and service delivery across your IT and Data networks/s without additional spend.

The report will also provide a clearly unbiased document that, should you need to spend valuable budget prove that you are making decisions based on accurate and unbiased facts and metrics, and support your case for any "really necessary" capital outlay.

Clearly demonstrating that all possible alternative avenues have been explored, and that truly unbiased due diligence has been carried out.

***"Ensure that you are getting the best out of your existing IT infrastructure before you waste money.... unnecessarily."***
