

Shouldn't you be taking a Serious long term view of your I.T. Security?

According to CERT the number of reported security vulnerabilities has grown exponentially each year to around 8,000 in 2008 - that's 670 new vulnerabilities per month, 155 a week, 22 per day.

The majority of these vulnerabilities are targeting your business critical applications. Firewalls can do very little to protect against application layer vulnerabilities.

**"How vulnerable are you
today...tomorrow...next week...next
month?"**

The Solution: Our Managed Vulnerability Assessment Services

To stay on top of these vulnerabilities and ensure they're not exploited take our annual managed vulnerability assessment service. Each month, or more frequently, we will run a comprehensive up-to-date set of non-destructive security tests to determine how vulnerable your key Internet facing business assets are.

Our monthly findings are presented in an easy to view HTML report that contains corrective actions, management overviews and executive trends.

For organisations that want to actively reduce the business risks they face, our managed vulnerability assessment services will provide many benefits:

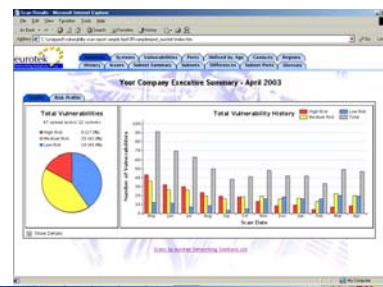

- Independent and objective assesment
- Ongoing protection against the latest security exploits
- Guards against human error, e.g. developers' software bugs, server or incorrect firewall configuration
- Verifies effectiveness of other security controls and policies
- Prevents security beaches and thereby :
 - Protects your company's reputation (reducing adverse media coverage, customer dissatisfaction, loss of public confidence etc.
 - Reduces costs (fewer security incidents from which to recover, fewer compensation or litigation claims etc.)
- Demonstrates 'best practice' in addressing risk (ITIL,Turnbull, Basel Capital Accord, ISO17799, Sarbanes Oxley, PCI DSS), and in meeting Corporate Governance objectives
- More cost effective than doing it 'in-house'
- Frees up staff to concentrate on core business activities
- Very low management overhead

" Eurotek's Network Security services and on-going Vulnerability scanning, and reporting have ensured that we keep on top of threats and maintain Data and I.T. integrity"

**IT OPERATIONS
THE ROYAL INSTITUTION OF CHARTERED SURVEYORS**

Our Enterprise service is a full vulnerability assessment service examining the vulnerabilities presented by your internet reachable systems. The service lasts for one, or more years (renewable), and scans / reports are performed, typically once per month. Features include:

- Best of class blended assessments (both automated and manual testing)
 - finds vulnerabilities not discoverable by automated-only testing
 - crafted examples to ease understanding
 - "Root cause" vulnerabilities reported
 - Personalised 'role driven' HTML reports that are easy to view, free from false positives and contain remedial actions
 - Reports track organisational vulnerability, remediation and risk metrics
 - Flexible scheduling options
 - All testing is non-destructive, low bandwidth and continually updated
 - Payment Card Industry approved testing service
 - Thousands of application layer security tests, each with suggested fixes

This screenshot displays a detailed report titled 'Year Company Scan Results - April 2003'. It features a table with the following columns: IP Address, System, Report, Status, and Remediation. The table lists various scanned systems and their associated vulnerabilities, with status indicators in colored cells (red, yellow, green).
